

Vaultline

Private bilateral CBTC credit desk on Canton

HackCanton League Season 3 · Financial Applications · BitSafe Contribution path

Propose → Accept → Lock CBTC → Disburse USDCx → Repay or Liquidate

The problem

Credit officers and bilateral lenders on Canton struggle to originate, fund, and close a named CBTC-collateralized USDCx loan between two specific parties because existing Canton lending apps are pool / money-market UX.

Off-ledger workarounds

Bilateral terms live in chat and sheets while custody sits elsewhere.

Unclear custody

No shared Desk authority to lock, release, or seize CBTC on one deal.

Pool mismatch

Market-wide params don't match a named lender funding a named borrower.

The solution — Vaultline

A private loan-origination and collateral-control workspace for bilateral CBTC lending on Canton — not a pooled money market.

Differentiation

- Named lender funds a specific borrower — not shared pool liquidity
- Per-loan negotiated terms — not market-wide params
- Desk-controlled CBTC custody with repay+release or LiquidateFast on that agreement

Who it's for & why it matters

Ideal customer

- Crypto-native bilateral / OTC credit desks
- Day-to-day user: credit officer / risk ops
- Buyer: desk head / product lead
- Pain: pool UX can't run named deals
- Job: lock terms + custody + close in one workflow

Why Canton

- Confidential bilateral positions
- Multiparty credit + custody workflows
- Atomic propose → lock → disburse → close
- Public chains expose counterparties
- Databases don't settle across parties

Product & tech stack

Hackathon MVP on Canton LocalNet — contracts first, then operator console.

Contracts	Canton / Daml 3.4 — credit application, custody, loan, LiquidateFast
Tokens	CIP-0112 pin/adaptor placeholders for CBTC & USDCx (no invented hashes)
LocalNet	Sandbox Ledger API Path A — happy + liquidate reproducible
UI	Vite/React operator console (mock + Grofty live path when whitelisted)
Integrations	Grofty auth stubs · BitSafe/DecMan scaffold (honest FUTURE markers)

What's working today

LocalNet Path A

Happy path + liquidate on Ledger :6865 — exit 0

Contribution demo

`./scripts/contrib-demo.sh` → `CONTRIB_DEMO_PASS`

Tests

daml test green · health-check scripts

Honesty

0 fake MainNet claims · Contribution if Gold never approved

Metrics (honest)

North Star: complete bilateral loan cycles per week (propose → accept → lock → disburse → repay or liquidate).

User interviews	0 — category evidence only (Alpend / ACME)
External demo users	0 — internal LocalNet green
DevNet / MainNet txs	0 — LocalNet until pins + access
90-day target	≥10 desk conversations · ≥1 design-partner cycle

Go-to-market

- Positioning: bilateral desk vs pool money markets
- First customers: crypto-native OTC / prop credit desks already on Canton
- Channels: HackCanton submit · Canton community · BitSafe path · direct desk outreach
- Business model hypothesis: B2B SaaS / DAR license — pilot free, then seats + per-loan fee (untested)
- 90 days: interviews → token pins / DevNet if available → design-partner LOI

Thank you
